

A Powerful Building Information Modelling Solution for Civil Engineering

Use an integrated process built on a co-ordinated, consistent, digital model for design, analysis, visualisation, documentation and construction.

One Model. One Change. Multiple Updates. All Automatic. Building information modelling (BIM) is an integrated process for exploring a project's key physical and functional characteristics digitally, before it's built. AutoCAD Civil 3D software is Autodesk's building information modelling solution for civil engineering. The software creates co-ordinated, data-rich models that enable you to conduct analysis from the earliest stages of design, better visualise and simulate real-world appearance, performance and cost and document designs more accurately.

AutoCAD Civil 3D produces a single model, with intelligent and dynamic data, enabling you to make a design change at any stage of the process more quickly. Make better-informed decisions and choose design alternatives based on analytical and performance results. Produce visualisations that remain in sync with design changes as they are made more quickly and efficiently. The model reflects any changes to drafting and annotation automatically throughout the project.

AutoCAD Civil 3D offers adaptable tools that enable me to provide innovative solutions to a seemingly endless array of civil engineering problems.

—Cristian Otter
Senior Designer, Large Infrastructure Department
Breijjn B.V.
The Netherlands

Learn More or Purchase
Access specialists worldwide who can provide product expertise, a deep understanding of your industry and value that extends beyond your software licence purchase. To license AutoCAD Civil 3D software, contact an Autodesk Premier Solutions Provider or Autodesk Value Added Reseller. To locate the reseller nearest you, visit www.autodesk.co.uk/reseller.

Autodesk Learning and Education
From instructor-led or self-paced classes to online training or education resources, Autodesk offers learning solutions to fit your needs. Get expert guidance at an Autodesk Authorised Training Centre (ATC®) site, access learning tools online or at your local book shop and validate your experience with Autodesk certifications. To learn more, visit www.autodesk.co.uk/atc.

Autodesk Services and Support
Help accelerate return on investment and optimise productivity with companion products, consulting services and support from Autodesk and Autodesk authorised partners. Designed to get you up to speed and keep you ahead of the competition, these tools and services can help you make the most of your software, no matter what industry you are in. To learn more, visit www.autodesk.co.uk/servicesandsupport.

Autodesk Subscription
Autodesk® Subscription gives you immediate access to software upgrades for your Autodesk software. If these are released during your Subscription term, as well as exclusive access to service and support benefits designed to help you get the most out of your Autodesk software. To learn more, visit www.autodesk.co.uk/subscription.

Explore. Analyse. Optimise.

Autodesk

Deliver More Innovative Project Solutions

AutoCAD Civil 3D offers a better way of designing, analysing and documenting civil engineering projects.

AutoCAD® Civil 3D® software enables you to deliver higher-quality transportation, land development and environmental engineering projects faster. The software's purpose-built tools support building information modelling (BIM) processes and help reduce the time it takes to design, analyse and implement changes. The result is that you can evaluate more what-if scenarios and optimise project performance.

Civil 3D software's tools for surveying and design help streamline project workflows by automating time-consuming tasks.

Surveying
Survey functionality is fully integrated in Civil 3D, so you have a more consistent environment for all tasks, including direct import of raw survey data, least-squares adjustment, editing of survey observations and automated creation of survey figures and surfaces. You can create and edit survey figure vertices interactively and identify and edit crossing breaklines to avoid potential issues, resulting in points, survey figures and surfaces that can be used throughout the project.

Surfaces and Grading
With Civil 3D, you can build surfaces from traditional survey data, such as points and breaklines. Utilise large data sets from aerial photogrammetry, laser scanning and digital elevation models by taking advantage of the surface reduction tools. View the surface as contours or triangles or create elevation and slope banding analysis. Use surfaces as a reference for creating intelligent objects that maintain dynamic relationships to the source data. Team members can use the powerful daylighting and grade projection tools to generate surface models for any type of grading projection.

Pipes

Use rules-based tools to lay out sanitary and storm drainage systems. Break or join existing pipe networks or make changes to pipe networks and structures using graphical or numerical input and conduct interference checks. Plot and complete final drafting of the pipe network in plan, profile and section views and share pipe network information, such as material and size, with external analysis applications.

Parcel Layout

The software enables you to generate parcels by converting existing AutoCAD® software entities or by using more flexible layout tools to automate the process. A change to one parcel is automatically reflected in neighbouring parcels. Advanced layout tools include options for measuring frontage at an offset and laying out parcels by minimum depth and width.

Corridor Modelling

Corridor modelling combines horizontal and vertical geometry with customisable cross-sectional components to create a parametrically defined, dynamic 3D model of roads and other transportation systems. Use the included subassemblies – ranging from travel lanes, pavements and ditches to complex lane components – or create your own based on a design standard. The model can be modified easily via visual interaction or by changing input parameters that define the roadway typical section. Unique characteristics of each subassembly allow the 3D model to target known features.

Earthwork Calculations

The software enables you to process earth volumes between your existing and proposed surfaces more quickly using composite volume or average end area methods. Generate mass haul diagrams for analysing the distance over which cut and fill can balance, the amount of material to be moved, the direction of movement and the identification of borrow pits and dump sites.

Criteria-Based Geometric Design

Lay out plan and profile alignment geometry more quickly with design criteria based on government standards or customised for clients' needs. Design constraints alert users when standards violations occur, providing immediate feedback so necessary modifications can be made.

Purpose-Built Tools for Road and Highway Design

Transportation-specific design tools offer a more efficient way to design roads and highways. Build interactive intersection models that update dynamically. Focus on optimising the design, knowing that production drawings and annotations will stay up to date. Lay out roundabouts more quickly, including signage and striping, based on common design standards.

Quantity Takeoff Analysis

Extract material quantities from corridor models or assign material types to lightposts, landscaping and more. Run reports or utilise built-in pay item lists to help generate bid-ready contract documents. Make better decisions about the cost of the project earlier in the design process with more accurate quantity takeoff tools.

Enjoy Higher-Quality Documentation and Better Co-ordination

Deliver more consistent construction documentation that remains synchronised even as design changes are made to the model.

By connecting design and documentation intelligently, AutoCAD Civil 3D helps you boost productivity and deliver higher-quality designs and construction documentation. Civil 3D's styles-based drafting helps reduce errors and promotes documentation consistency.

Production Drafting

Generate production plans such as fully annotated section sheets, profiles, grading plans and more automatically. Most importantly, drafting can be generated across multiple drawings by using xrefs and data shortcuts. The result is a workflow that enables production sheets to use a single instance of the model. And if the model changes, you can synchronise all production sheets to reflect the update more quickly.

Plan Production

Comprehensive tools assist with the layout of cross section and plan and profile sheets. Fully integrated with the AutoCAD software's Sheet Set Manager, the Plans Production wizard automates the layout of sheets and matchlines along alignments and generates plan and profile sheets based on the layout. The finished product is a series of drawing sheets ready for final annotation and plotting.

The map books functionality lays sheets out across your project while generating key maps and legends for your entire sheet set. This capability is ideal for laying out utility maps and grading plans.

Annotation

The software's annotation is derived directly from design objects or through external references and updates automatically when the design changes. It also responds to changes in drawing scale and view orientation automatically, so labels update instantly when the plot scale is changed or rotated within different viewpoints.

Reporting

AutoCAD Civil 3D software provides more flexible, real-time and extensible report generation. As the data is derived directly from the model, reports can be updated more easily, providing quicker feedback as design changes are made.

Drafting Styles and Standards

AutoCAD Civil 3D provides country-specific CAD styles to control many aspects of drawing display. Colours, linetypes, contour increments, labelling and much more are fully controlled by styles.

Data Shortcuts and References

With data shortcuts and xrefs, project members can share model data such as surfaces, alignments and pipes, working off the same instance of a design object for multiple design tasks. Annotation can also be generated from the data shortcuts or directly through an xref to help production drafting remain in sync.

Advanced Data Management

For companies looking for advanced data management, the addition of Autodesk® Vault technology enhances data shortcut functionality with advanced change management, version control, user permissions and archive control.

Design Review

Today, the engineering process is more complex than ever. Design review often involves team members who are not CAD software users yet are vital to the project. Publishing to DWF™ file format enables you to extend design review to your team digitally.

Multi-discipline Co-ordination

Import Autodesk® Revit® Architecture software building shells into AutoCAD Civil 3D to use information such as utility connection points, roof areas and building entrances directly from architects. Similarly, transportation design engineers can pass information such as profiles, alignments and surfaces directly to the structural engineers to assist in the layout of bridges, box culverts and other transportation structures in Autodesk® Revit® Structure software.

Optimise Performance with Analysis and Visualisation

Explore more what-if scenarios earlier in the design process and communicate your winning ideas with best-in-class 3D visualisation tools.

AutoCAD Civil 3D software's integrated analysis and visualisation tools help you evaluate what-if scenarios, so you can realise innovative designs faster.

Stormwater Analysis and Simulation

Design and analyse stormwater systems with integrated simulation tools for collection systems, ponds and culverts. Help reduce post-development runoff and prepare reports to support sustainability requirements for stormwater quantity and quality. Evaluate more design alternatives, including innovative green best management practices to create a more environmentally sensitive and visually appealing design. Prepare more accurate construction documents, including hydraulic and energy grade lines, to assist in evaluating the design and helping to ensure public safety.

Geospatial Analysis and Mapping

AutoCAD Civil 3D includes geospatial analysis and mapping capabilities to support engineering-based workflows. Analyse spatial relationships between drawing objects. Extract or create new information by overlaying two or more topologies. Create and use buffers to select features within the specified buffer distance of other features. Use publicly available geospatial information to assist with site selection and better understand design constraints at the proposal stage of a project. Generate robust mapping exhibits to help meet requirements for sustainable design.

Point Clouds

Create point clouds in AutoCAD Civil 3D using data from LIDAR. Import and visualise point cloud information; style point data based on LAS classifications, RGB, elevation and intensity; and use data to create surfaces, perform site surveys and digitise as-built features for civil engineering design projects.

Sustainable Design

AutoCAD Civil 3D software can help to make civil engineering projects more sustainable. By combining the robust model of the site conditions and design constraints with the powerful ability to evaluate alternatives, you can consider more innovative and environmentally sensitive designs. AutoCAD Civil 3D includes tools to assist with many aspects of recognised sustainability initiatives, such as LEED®, by providing analysis to study linkage, project orientation, stormwater management alternatives and more.

AutoCAD Platform

AutoCAD Civil 3D is built on the AutoCAD® platform, one of the world's leading CAD programs. Take advantage of the millions of professionally trained AutoCAD users worldwide to share and complete projects faster. AutoCAD software's DWG™ file format enables you to save and share files with confidence. DWG technology from Autodesk is the more accurate and reliable way to store and share design data.

Visualisation

Create more powerful visualisations that give stakeholders an opportunity to envisage the project better before it is built. Produce visualisations directly from the model for several design alternatives to help understand the impact of the design on the community and the surrounding environment better. Publish the model to Google Earth™ mapping service for even greater understanding of the project in context. Make near-photorealistic renderings of your models using Autodesk® 3ds Max® Design software. Simulations using the Civil 3D model can be created in Autodesk® Navisworks® software, which can help project stakeholders better understand how the project will look and perform once built.

64-bit Support

AutoCAD Civil 3D supports 64-bit operating systems, enabling the software to handle larger projects and improving performance and stability for memory-intensive tasks.
